

std::runtime_error

```
classDiagram
    class std_runtime_error["std::runtime_error"]
    class WAL_WalError["WAL::WalError"]
    WAL_WalError --|> std_runtime_error
```

The diagram illustrates an inheritance relationship. At the top is a class box for `std::runtime_error`, which is divided into three horizontal sections: the top section contains the class name, and the two bottom sections are empty. Below it is a class box for `WAL::WalError`, also divided into three horizontal sections. The top section contains the class name, the middle section is empty, and the bottom section contains a list of four public methods: `+ WalError()`, `+ WalError()`, `+ ~WalError()`, and `+ operator=()`. A blue arrow with an open triangular head points from the top of the `WAL::WalError` box to the bottom of the `std::runtime_error` box, indicating that `WAL::WalError` inherits from `std::runtime_error`.

WAL::WalError

+ WalError()
+ WalError()
+ ~WalError()
+ operator=()
